Summary of scientific research

I helped create a new branch of economics, "The Economics of Information", exploring the consequences of information asymmetries and pioneering such pivotal concepts as adverse selection and moral hazard, which have now become standard tools not only of theorists, but of policy analysts. I have made major contributions to macroeconomics and monetary theory, to development economics and trade theory, to public and corporate finance, to the theories of industrial organization and rural organization, and to the theories of welfare economics and of income and wealth distribution. In the 1980s, I helped revive interest in the economics of R&D. My work has helped explain the circumstances in which markets do not work well, and how selective government intervention can improve their performance. In 2009 I chaired the Commission of Experts on Reforms of the International Monetary and Financial System, which was convened by the President of the United Nations General Assembly "to review the workings of the global financial system, including major bodies such as the World Bank and the IMF, and to suggest steps to be taken by Member States to secure a more sustainable and just global economic order".
